1. Introduction to Phase 3

This document contains the full submission for the FoodSaver Phase 3 application, as designed by _____ in the CIS422 Human-Computer Interaction course at Imam Abdulrahman Bin Faisal University.

Phase 3 follows directly upon the work accomplished in Phase 2 (Assignment 2), where the pre-design groundwork was accomplished through user analysis, task analysis, competitive system analysis, and the selection of the User-Centered Design (UCD) paradigm. The purpose of Phase 3 is to take the analytical work accomplished in Phase 2 and turn it into concrete interface designs, culminating in a high-fidelity interface prototype ready for usability testing.

2. Initial Paper Prototype

This section presents the Initial Paper Prototype of the FoodSaver application. These five interfaces were created as a direct response to the results of Phase 2 (Assignment 2), where there is a quantitative analysis of the users with 35 participants, a task analysis where six basic user tasks are established, and the adoption of the User-Centered Design (UCD) framework as the design methodology of choice.

Paper prototyping is a well-established approach in the overall process of designing a Human-Computer Interaction system. This approach enables the designer to visualize the interface ideas and test the layout of the interface in a relatively rapid manner before proceeding with the development of the interface. Paper prototyping is intentionally unattractive and sketch-like in nature in order to facilitate flexibility in the process.

2.1 Design Framework: User-Centered Design (UCD)

The User-Centered Design framework was chosen in Phase 2 for the following reasons, which guided all interface design decisions in this prototype:

- Food waste is closely related to daily user behaviors such as food storage, shopping for groceries, and preparation of meals. A framework that takes user behavior into consideration, rather than assumptions, is thus crucial.
- The survey conducted in Phase 2 identified user needs that can be measured, for instance, where 54.3% of users require reminders for expired goods, and 34.3% require checkboxes. These factors guided all design decisions in this prototype.
- The iterative methodology of UCD is similar to that of this project, where there is a series of phases: design, refine, expand, and so on.

- The Persuasive System Design theory by Fogg in 2009, discussed in Phase 2, supports this project, where a user is persuaded to change behavior by giving gentle nudges, unlike forcing a user to comply, which is evident in this prototype.

2.2 Navigation Flow Between Screens

The five screens are connected through a persistent Bottom Navigation Bar visible on every screen, ensuring that users can always navigate freely without getting lost. In addition to the global navigation bar, specific in-screen actions create contextual navigation flows between related screens:

- The Expiry Alert Banner on the Home screen links directly to the Calendar screen.
- The 'Add Food' Quick Action on the Home screen navigates to the Inventory screen.
- The '+ Set Expiry Date' button on the Inventory screen navigates to the Calendar screen.
- The Inventory screen passes the selected ingredients directly to the Recipes screen.
- The 'Share Your Recipe' button on the Community screen opens a recipe submission form.

2.3 The Five Interfaces

The following five screens represent the initial paper prototype of FoodSaver. Each screen is accompanied by a detailed description of its elements and a justification section linking the design decisions to specific outcomes from Phase 2.

Screen 1 — Home

The Home screen is the first screen the user sees when the application is opened. The primary purpose of the screen is to provide a high-level snapshot of the user's food management status and for access to all core features.

The screen is divided into four Major parts.

- The Welcome Banner has a nice message that recognizes the user being back and sets a friendly tone.
- Quick Stats (2×2) – Which simply displays (in four boxes) how many food items are currently in your inventory, how many are about to expire, how many recipes you've added, and how many recipes are shared with the community.
- Quick Actions refers to four shortcut buttons that enable direct navigation to four core sections: Add Food (Inventory), Add Recipes, Calendar and Donate Food. It eliminates unnecessary steps for repeated actions.
- A highlighted yellow warning banner is displayed at the bottom of the content area warning customers about the expiry of the most urgent product and its deadline. This banner is the most noticeable object of the screen to make sure that it can't be missed.
- A bottom navigation bar is a persistent five-icon bar located at the bottom of the screen that allows access to all sections regardless of location.

Justification from Phase 2 (Assignment 2)

- ↳ 48.6% of survey participants reported throwing food away because it expired without their knowledge — the Expiry Alert Banner on the Home screen directly addresses this by making expiration warnings impossible to miss at first glance.
- ↳ UCD Framework principle: the most critical information must be surfaced at first glance to minimize cognitive load and support efficient decision-making.
- ↳ Quick Actions reduce the number of navigation steps required to reach core features, directly supporting the UCD efficiency principle and reducing user effort.
- ↳ Quick Stats address the identified user need for general awareness of food management status — 82.8% of participants are responsible for both grocery shopping and cooking, making this overview highly relevant.

Sub-Screen 1a — Donations (Charity Connect)

This screen is accessed from Screen 1 (Home) by tapping the “Donate Food” button in the Quick Actions section. It displays a list of nearby food charities based on the user’s location, under the title “Charity Connect — Find and support local food banks.” Each charity card shows the organization name, location, and a “Donate Now” button to proceed with the donation.

Sub-Screen 1b — Donate Food Form

This screen is accessed from Sub-Screen 1a by tapping the “Donate Now” button on any charity card. It allows the user to select food items from their inventory to donate, with urgency labels showing how soon each item expires (today, tomorrow, 2 days). The user can also adjust the quantity, add an optional note, and confirm the donation by tapping “Confirm Donation.”

The image shows a hand-drawn mobile application interface for donating food. At the top, there is a header bar with a back arrow and the title 'Donate Food'. Below this, the section 'CHARITY' is displayed, featuring a logo and the name 'Fitdal (Saudi Food Bank)' with a location pin indicating 'Dammam'. The next section, 'SELECT ITEMS TO DONATE', lists four items: Bread, Chicken, Milk, and Red Apple. Each item has a checkbox, an icon, and a label indicating its availability: 'today' for Bread, 'tomorrow' for Chicken, and '2 days' for both Milk and Red Apple. Below the list, a 'QUANTITY' section shows a minus button, the number '2', a plus button, and the text 'items'. At the bottom, there is a button labeled 'confirm donation' with a checkbox icon.

Sub-Screen 1c — Donation Sent (Confirmation)

This screen appears automatically after the user taps “Confirm Donation” in Sub-Screen 1b. It displays a “Thank You!” confirmation message indicating that the donation was successfully submitted, along with a Donation Summary showing the selected charity, donated items, and location. The user also receives +50 Green Points as a reward for donating, and can return to the Home screen by tapping “Back To Home.”

Justification from Phase 2:

The Donate Food feature directly addresses food waste by giving users an alternative to discarding expiring items. It aligns with the UCD framework by providing a meaningful and culturally relevant action — donating surplus food to local Saudi food banks — turning a potential waste moment into a positive community contribution.

Screen 2 — Food Inventory

The Food Inventory screen is where the user can log the food items that are currently available in their homes. The major decision in the design of this screen is the absence of the need for the user to manually type the names of the food items they are using. This is achieved by the use of checkboxes in the predefined categories of the food items.

The structure of the screen is as follows:

- Category Sections — the food items are grouped into categories such as vegetables, fruits, dairy products, and many more that can be accessed by scrolling the screen. Each category is visually separated and has an icon and the category's name for easy identification.
- Checkbox-Based Selection — the food items in each category are listed with checkboxes. Users tap a checkbox to mark an item as currently available in their home. Checked items are visually distinguished from unchecked ones.
- Set Expiry Date Button — a prominent dark button at the bottom of the screen. When tapped, it navigates the user to the Calendar screen (Screen 3) to assign expiration dates to the selected items. This creates a logical sequential flow between the two screens.
- Interaction Annotation — a subtle instructional note ('User taps checkboxes to select available ingredients') is displayed near the bottom to assist new users in understanding the interaction model.

The image shows a mobile application interface titled "Food Inventory". It features three main sections for food categories, each with a list of items and checkboxes for selection:

- Vegetables** (indicated by a green leaf icon):
 - ☒ Spinach
 - ☒ Tomato
 - ☐ Carrot
 - ☐ Onion
- Fruits** (indicated by a red apple icon):
 - ☒ Apple
 - ☐ Banana
 - ☒ Orange
- Dairy** (indicated by a milk carton icon):
 - ☒ Milk
 - ☐ Cheese
 - ☒ Yogurt

Below these sections is a dark blue button labeled "+ Set Expiry Data".

A note at the bottom of the main content area reads: "← User taps checkbox to select available ingredients".

The bottom of the screen features a navigation bar with five icons and labels: Home, Inventory, Calendar, Recipes, and Community.

Justification from Phase 2 (Assignment 2)

- ↳ 34.3% of survey participants explicitly preferred a checkbox-based inventory system over manual text entry — this finding directly determined the core interaction model of this screen.
- ↳ Task Analysis Task 1 from Phase 2: 'Inventory Logging via Categories' — predefined categories were identified as a key requirement for reducing cognitive load and simplifying the data entry process.
- ↳ UCD Framework: the design is based on observed real-world behavior of the target users — mothers, students, and domestic workers who manage food daily but have limited time for complex data entry.
- ↳ The '+ Set Expiry Date' button creates an intentional, guided navigation flow into Screen 3, supporting the UCD principle of natural mapping and task continuity.

Sub-Screen 2a — Item Details

This screen is accessed from Screen 2 (Food Inventory) by tapping on any food item. It displays all item details including Name, Category, Expiry Date, and Quantity, with Edit and Delete buttons for full item management.

The screenshot shows the 'Item Details' screen with a 'BACK' button at the top left. Below the title bar is a search bar. The main content area is titled 'All items' with a sort icon (up and down arrows). There are three item cards, each with a food icon, a list of details (Name, Category, Expiry Date, Quantity), and 'Edit' and 'Delete' buttons.

Item	Name	Category	Expiry Date	Quantity	Edit	Delete
Milk	Milk	Dairy	Mar 12	1	Edit	Delete
Apple	Apple	Fruits	Mar 19	3	Edit	Delete
Chicken	Chicken	Meat	Mar 25	1	Edit	Delete

At the bottom, there is a navigation bar with five icons: Home, Inventory, Calendar, Recipes, and Community.

Sub-Screen 2b — Edit Item

This screen is accessed from Sub-Screen 2a by tapping the Edit button. It allows the user to modify the item's Name, Category, Expiry Date, and Quantity through form fields and dropdowns, with Save and Delete options.

The screenshot displays the 'Edit Item' screen. At the top, there is a 'BACK' button with a left arrow. The title 'Edit Item' is centered. Below the title, the text 'Edit Milk Details' is shown. The form contains four fields: 'Name' with the value 'Milk', 'Category' with a dropdown menu showing 'Dairy', 'Expiry Date' with a date picker showing 'DD/MM/YYYY', and 'Quantity' with a dropdown menu showing '1'. At the bottom of the form are two buttons: 'Save' and 'Delete'. Below the form is a navigation bar with five icons and labels: 'Home', 'Inventory', 'Calendar', 'Recipes', and 'Community'.

Sub-Screen 2c — Set Expiry Date

This screen is accessed from Screen 2 (Food Inventory) by tapping the “+ Set Expiry Date” button after selecting the desired food items. It displays a monthly calendar view labeled “Do NOT use after” to help the user pick the expiration date for the selected items. Once the user selects a date, they tap the Save button to confirm and return to the Inventory screen.

Screen 3 — Expiry Calendar

The Expiry Calendar screen provides users with a visual, calendar-based overview of the expiration dates of all food items currently in their inventory. Rather than presenting expiration information as a plain list, the calendar format maps dates visually onto a familiar monthly grid — a design choice directly inspired by the UCD principle of leveraging existing mental models.

The screen contains the following elements:

- Monthly Calendar Grid — a standard calendar layout for the current month. The dates with one or more items expiring are visually indicated with a red border, catching the attention of the user regarding the dates without any further interaction with the date.
- Legend: The legend consists of a two-item legend added at the bottom of the calendar, providing a clear description to the user regarding the different icons used in the calendar. The filled dark circle indicates 'Today,' whereas the red border indicates 'Expiring.'
- Expiring Soon List: Below the calendar, a special section has been added containing all the items expiring soon in a manner that represents the urgency of the items.

- Tap Interaction: Tapping on the visually indicated dates with the red border enables the user to view the exact items expiring on the date, providing the user with the capability to drill down on the details without making the view messy.

Justification from Phase 2 (Assignment 2)

↳ 57.1% of survey participants reported that they do NOT regularly check expiration dates — the visual calendar format transforms expiration tracking from an active task into a passive, always-visible display.

- ↳ Task Analysis Task 2 from Phase 2: 'Expiration Scheduling' — users need a way to visualize food freshness over time, which the calendar directly fulfills.
- ↳ 54.3% of participants identified expiration reminders as the single most useful feature they wanted — this screen serves as the primary visual reminder system of the application.
- ↳ UCD Framework: the monthly calendar format mirrors the native smartphone calendar, ensuring near-zero learning curve for new users regardless of their technical proficiency.

Screen 4 — Recipe Suggestions

On the Recipe Suggestions screen, the system can also suggest recipes based on the food items the user has marked as available in Screen 2.

The Recipe Suggestions screen is designed to address one of the most frequently cited pain points from the Phase 2 survey: users know what food they have but not what to cook with it.

The screen will be composed of the following elements:

- You'll also notice that “Ingredient Tags” is a row of pill-shaped tags at the top of the screen indicating the main ingredients used for the recipe suggestion for the user (Spinach, Apple, Milk, etc.). The tag ‘+ more’ indicates additional ingredient is used for the recipe suggestion. This element relieves memory burden for the user as to what inventory is selected without having to go back.
- The list of suggested recipes is a scrollable list of recipe cards. Each recipe card displays the name of the recipe, estimated time to make the recipe, difficulty level of the recipe (Easy / Medium), and a badge for match percentage.
- A Match Percentage Badge is a dark pill badge that indicates the percentage of the required ingredients for the recipe that the user already has in their inventory. Using this metric, people can see which recipes are the easiest without having to read the ingredients.
- The tap to expand interaction is when you tap any card on the home screen, the card expands to show the full ingredient list and step-by-step instructions on how to cook the dish and save and share functionality.

Justification from Phase 2 (Assignment 2)

- ↳ 51.4% of survey participants expressed a specific need for recipe suggestions based on available ingredients — this is the highest-frequency feature request in the Phase 2 data, making it a core screen.
- ↳ Task Analysis Task 4 from Phase 2: 'Ingredient-Based Recipe Discovery' — the system should automatically suggest appropriate recipes when ingredients are selected.
- ↳ The match percentage score directly reduces cognitive load: users do not need to compare ingredient lists manually to assess feasibility — the system does this for them.
- ↳ The Ingredient Tags at the top of the screen address the UCD principle of reducing short-term memory load — users can always see what they selected without navigating back to the Inventory screen.

Sub-Screen 4a — Spinach Omelette Detail

This screen is accessed from Screen 4 (Recipe Suggestions) by tapping on the Spinach Omelette recipe card. It displays a hand-drawn illustration of the dish along with two tabs: Recipe and Comments. The Comments tab shows community reactions and feedback from other users, including dates and user avatars.

Sub-Screen 4b — Apple Yoghurt Smoothie Detail

This screen is accessed from Screen 4 (Recipe Suggestions) by tapping on the Apple Yoghurt Smoothie recipe card. It follows the same layout as Sub-Screen 4a, showing the dish illustration and an active community comments section with multiple positive reactions.

This supports Task 4 from Phase 2: Ingredient-Based Recipe Discovery, by completing the full recipe experience from suggestion to detailed instructions.

Screen 5 — Community

Through the Community screen, you can post your own recipe for use by other FoodSaver users while also browsing community recipes. A built-in quality control system, whereby all recipes that are shared are reviewed by a competent home cook before they become visible, was outlined in Phase 2 Task Analysis. This feature shows the cultural insight that food knowledge is an essential currency in the Saudi homes.

The screen contains the following elements.

- A full-width, dark button that draws focus at the top of the page to share the recipe. Tapping it opens the recipe submission form, allowing users to share recipes instantly.
- The Community Recipes List is a list of recipes that other users have shared. A contributor's avatar (initials), recipe name, creator name, number of likes, number of comments and verification badge appears on each entry.
- Verified Badge (green) – assigned to those recipes that have been checked and confirmed by a seasoned home cook. These recipes have been tested and users can trust.
- The yellow pending badge means that a recipe has been submitted to the expert but is waiting for review. Pending recipes can still be seen by the users but with an unverified message.
- A yellow banner at the bottom of the screen expressly states, “Recipes are reviewed by expert mothers before the final approval”. This not only increases the credibility of the service but also manages user expectations.

Justification from Phase 2 (Assignment 2)

- ↳ Task Analysis Task 5 from Phase 2: 'Social Interaction and Sharing' — users should be able to share recipes, comments, and culinary experiences through a community forum.
- ↳ Task Analysis Task 6 from Phase 2: 'Recipe Validation (Expert Task)' — experienced home cooks should review and approve submitted recipes before they become accessible to all users.
- ↳ The Verified/Pending badge system builds measurable user trust in shared content — a critical factor for community engagement and content quality.
- ↳ UCD Framework: the community feature was specifically designed with cultural context in mind — sharing food knowledge, traditional recipes, and cooking experiences is a central social practice in Saudi households, particularly among women.

Sub-Screen 5a — Kabsa with Leftovers Detail (Verified)

This screen is accessed from Screen 5 (Community) by tapping on the Kabsa with Leftovers recipe card. It shows that the recipe was submitted by Fatimah M. and has been approved by expert mothers, indicated by the Verified badge at the top. The screen includes Recipe and Comments tabs, with an active comment section showing high community engagement, and an “Add comment” field at the bottom allowing users to participate in the discussion.

This supports Task 6 from Phase 2: Recipe Validation, where experienced mothers review and approve recipes before they are visible to all users.

3.Design Refinement

Design Refinement Based on User-Centered Design

The design refinements in this phase were done based on the User-Centered Design framework, which focuses on understanding the Food Storage App users needs, behaviors and challenges. To support this process, we collected Food Storage App user feedback through face-to-face interviews allowing us to gather in-depth insights about Food Storage App user experiences.

Based on these interviews several usability issues were identified, such as difficulty in tracking food items lack of clarity in some interfaces and high cognitive effort required for tasks. Therefore, the design improvements aimed to:

- Reduce load by simplifying interactions and minimizing Food Storage App user effort
- Improve usability and clarity through better organization and visual design
- Enhance Food Storage App user experience by aligning the Food Storage App system with actual Food Storage App user needs

In addition to applying the Golden Rules of Design the refinement process was supported by an iterative design method based on Food Storage App user feedback analysis. After conducting interviews common usability problems were. Addressed through continuous improvements. This iterative approach ensured that design decisions were based on real Food Storage App user insights than assumptions aligning with the principles of User-Centered Design.

Interface 1: Home Screen

The expiration alert was moved from the bottom of the screen to the top to increase visibility and attract the Food Storage App users attention effectively. A "View Items" button was also added to provide access to the relevant items along with a notification icon that navigates Food Storage App users to the notifications page.

Golden Rules:

- Offer Informative Feedback: to clearly display food status and alert Food Storage App users.
- Enable Shortcuts: to provide access to important features.
- Reduce Memory Load: by presenting information without requiring Food Storage App users to remember or search for it.

Interface 2: Donations Screen

We heard from users in interviews that they want a place to see their donations and how they've contributed. So we added a Donations screen. This screen helps users track their donations, points, badges and the difference they're making.

You can find this screen easily by tapping the menu icon in the Home screen. It's a way to get to information about your donations.

Here are some key goals for this screen:

- Let users be in control: they can check their donations whenever they want.
- Make it easy to access: users can get to donation info, from the main menu.
- Show users what they've done: the screen clearly shows donation status, points and impact.

Interface 3: Inventory Screen

The instructions were moved from the bottom of the screen to the top with guidance on how to use the feature. This helps Food Storage App users understand the process without needing to search for instructions.

Golden Rules:

- Reduce Memory Load: by minimizing the need to remember steps.
- Offer Informative Feedback: by guiding Food Storage App users on how to use the Food Storage App system.

Interface 4: Calendar Screen

The instructions were moved from the bottom to the top of the screen making them more visible. A clear indication was also added to show that Food Storage App users can tap on dates to view details improving discoverability.

Golden Rules:

- Offer Informative Feedback: to clarify how Food Storage App users can interact with the calendar.
- Reduce Memory Load: by reducing guesswork.

Interface 5: Recipes Screen

The instructions were moved from the bottom to the top of the screen along with added guidance on how to interact with recipes. Additionally, the meaning of the match percentage was clarified to reduce confusion.

Golden Rules:

- Reduce Memory Load: by eliminating the need to remember functions.
- Offer Informative Feedback: by explaining Food Storage App system features and percentages.

Interface 6: Recipe Details

A save feature was added to allow Food Storage App users to store recipes and access them through settings. Additionally, a like feature was introduced to show Food Storage App user ratings and encourage interaction. These elements were consistently placed across all recipe screens to ensure uniformity.

Golden Rules:

- Strive for Consistency: by keeping elements in the place across screens.
- Offer Informative Feedback: by displaying Food Storage App user engagement through likes.
- Support Food Storage App User Control: by allowing Food Storage App users to save and revisit recipes.

Interface 7: Community Screen

Clear explanations for status labels (Verified / Pending) and rating indicators were added at the top of the section to help users understand the meaning of approved and pending recipes, as well as how the rating system works. This reduces confusion and allows users to interpret recipe credibility more easily.

Golden Rules:

- Offer Informative Feedback: to clearly explain recipe status and ratings.
- Reduce Memory Load: by eliminating the need to interpret meanings or guess.

Interface 8: Forum Screen

A sorting feature was added to improve content organization and allow Food Storage App users to easily access the recent posts. Additionally, a "New Post" button was clearly added at the bottom of the screen to enable Food Storage App users to create new posts without searching for the option.

Golden Rules:

- Enable Shortcuts: to provide access to key actions.
- Support Food Storage App User Control:, by giving Food Storage App users control over content organization.
- Offer Informative Feedback: by presenting navigation and sorting options.

4. Final Paper Prototype

The final paper prototype is the final result of both the original and refined versions constructed using user-centered design principles and based on feedback from previous stages.

At this stage, the design was expanded into a more detailed design that supports the user tasks identified in Phase 2. The prototype is designed to improve ease of use, understandability and interaction efficiency.

In order to cover basic features of the system: inventory management, item tracking, notifications and recipe suggestions, a set of (15+) interfaces were designed. Each interface was designed to be consistent, simple and intuitive.

Interface 1: Add Recipe Screen

← BACK Add Recipe

Add New Recipe

upload Image:

Name:

Ingredients:

Instructions:

Cooking Time: ▼

Difficulty: ▼

Home Inventory Calendar Recipes Community

With this screen, users can add a new recipe to the system. Users have the ability to upload an image, as well as provide the recipe name, ingredients, and instructions. Moreover, users have the option to select the cooking time and the level of difficulty. The design guarantees a simple structure and easy input process to improve usability.

Interface 2: Expiring Items Screen

This screen displays products that are about to expire. It helps users to quickly identify which items should be used soon. The system provides quick actions to search for recipes, or to edit item information.

Interface 3: Item Details Screen

This interface displays detailed information for each item, such as its name, category, expiry date, and quantity. Users can also edit or delete items with ease, which facilitates improved inventory management.

Interface 4: Edit Item Screen

← BACK

Edit Item

Edit Milk Details

Name:

Category: ▼

Expiry Date:

Quantity: ▼

Save Delete

Home Inventory Calendar Recipes Community

This screen provides users the ability to change details about the item, including its name, category, expiry date, and quantity. The layout is straightforward and structured to assist users in updating data efficiently and without confusion.

Interface 5: Delete Confirmation

This dialog appears when the user attempts to delete an item. It asks for confirmation to prevent accidental deletion and this improves system safety and user control.

Interface 6: Notifications Screen

This screen shows notifications that alert users about items that are close to expiration. It helps users stay informed and take action at the right time.

Interface 7: Success Message

After changes have been saved, this screen shows a confirmation message. It offers the user clear feedback, guaranteeing that the action was completed successfully.

Interface 8: Community Forum

This interface shows the screen a user will see when accessing the forum. allows users to share tips, facilitating a community environment to encourage food saving.

Interface 9: Recipe details

These are the interfaces that show some of the recipes, and what the user should expect. It includes a saving feature in case the user wants to revisit the recipe, as well as a tab to check the comment sections. There's also the option to show support by giving it a like, which

follows the standard and expectation that one would expect from a feature that has a social aspect.

Interface 10: Recipe comment section

These interfaces are the comment section that allow users to share their thoughts, which will increase their appreciation of the recipes, as well as keep a sense of community.

Interface 11: Settings

Setting related interfaces that allow the user to adjust preferences, account, and gives the user access to their liked and saved list of recipes.

Interface 12: Donation Process and User Impact

Donation and impact interfaces that let the user find nearby charities, see their locations, pick specific food items for donation, and track their environmental impact and earned badges.

5. High-Fidelity Prototype

Prototype link:

<https://www.figma.com/design/Xtg1HQsOoXyGRVVG9GWx7d/Untitled?node-id=0-1&t=4J8s3g6rnw5ikDwM-1>
